Abstracts

The global Adhesiveless FCCL market size is expected to reach \$ 1233 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032). Flexible copper-clad laminate (FCCL) refers to a copper-clad laminate formed by bonding one or both sides of flexible insulation materials such as polyester film or polyimide film to copper foil through a certain process. Flexible copper-clad laminates are divided into two categories: one is the traditional three-layer flexible copper-clad laminate with adhesive (3L-FCCL), and the other is the new two-layer flexible copper-clad laminate without adhesive (2L-FCCL). Adhesiveless FCCL do not use adhesives such as epoxy resin or acrylic ester, only use flexible insulation materials as the insulation layer. At present, the insulation layer materials used for manufacturing non adhesive flexible copper-clad laminates mainly include polyimide PI film, polyester PET film, and liquid crystal polymer LCP film. In 2025, global Adhesiveless FCCL production reached approximately 81,560 K Sq m, with an average global market price of around US\$ 10.37 per Sq m.

The market for adhesive free flexible copper-clad laminates is shifting from 'material upgrade options' to 'basic materials for high-end flexible circuits', driven by the continuous increase in dielectric performance, dimensional stability, and thermal reliability from high-frequency, high-speed, and high reliability applications. Compared to products with adhesive, the non adhesive structure reduces the dielectric loss and moisture absorption caused by the adhesive layer, making it more stable in high-temperature reflow, multiple bending, and fine circuit processing. Therefore, its penetration rate in high-end consumer electronics, automotive electronics, and some high-speed interconnect scenarios continues to increase.

From the demand side, the internal interconnection of intelligent terminals continues to develop towards thinner, lighter, and higher density. The dependence of camera modules, foldable screens, antennas, and high-speed interfaces on low loss and high

dimensional stability materials has increased, making it easier for adhesive free FCCL to enter the list of high value-added part numbers. Automotive electronics is a more certain medium to long term increment, with cabin displays, ADAS sensors, and high-speed connections in vehicles requiring more stringent environmental temperatures and higher lifespan requirements. The advantages of adhesive free FCCL in heat resistance and reliability are easier to fulfill as stable orders. At the same time, mSAP and the trend towards fine circuits are driving higher requirements for copper foil adhesion, surface roughness control, and cleanliness at the material end. Non adhesive FCCL has the structural advantage of adapting to high-end processes due to its more controllable interface.
