According to our (Global Info Research) latest study, the global Adsorption Vacuum Pump market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

An adsorption vacuum pump is a type of vacuum pump that operates on the principle of adsorption. It is designed to create a vacuum or low-pressure environment by removing gas molecules from a chamber or system. The pump consists of a housing or chamber containing a porous material with a large surface area, typically activated carbon or molecular sieve. When the pump is activated, the porous material selectively adsorbs gas molecules from the chamber. This adsorption process reduces the gas pressure inside the chamber, creating a vacuum.
