Abstracts

The global Adult Immune Cell Storage market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Immunotherapy is an emerging treatment method that uses a patient's own immune cells to fight life-threatening diseases such as cancer. This is important because the average person's chance of developing cancer in their lifetime is about 33 percent and increases with age. As of 2023, there are currently at least 6 FDA-approved cellular immunotherapies for cancer treatment, with more being investigated every day.

Immune cell storage refers to the use of biotechnology to extract a certain number of healthy immune cells from the human body. After testing and identification, they are stored in deep-temperature liquid nitrogen tanks at -150°C to -196°C to maintain the activity of immune cells for a long time, is a functional kind of business. Immune cell banking utilizes healthy cells to treat diseased cells, such as cancer cells. Immune cells can specifically scan the body for mutations that may be linked to cancer. When they do find these mutations, the cells work to eliminate them. Immune cells are an important line of defense for the human body to resist the invasion of foreign substances and eliminate aging, mutated, and cancerous cells. Human immunity reaches its peak at the age of 20. With age, environmental deterioration, bad living habits and other factors, the number of immune cells and Quality continues to decline and incidence rates gradually increase. When the body is in good condition, immune cells are stored in advance and health assets are proactively managed.
