Abstracts

According to our (Global Info Research) latest study, the global Advanced CO2 Sensors market size was valued at USD 466.6 million in 2023 and is forecast to a readjusted size of USD 708.7 million by 2030 with a CAGR of 6.2% during review period.

A carbon dioxide (CO₂) sensor is a device used to measure the concentration of carbon dioxide gas in the atmosphere. The Advanced CO₂ Sensor is an instrument for the measurement of carbon dioxide gas. The most common principles for CO₂ sensors are infrared gas sensors (NDIR) and chemical gas sensors. Measuring carbon dioxide is important in monitoring indoor air quality, the function of the lungs in the form of a capnograph device, and many industrial processes. NDIR CO₂ sensors detect and monitor CO₂ in the air based on the absorption of infrared (IR) light at a given wavelength. An IR lamp directs light waves through a tube towards a filter. The amount of IR light that passes the filter is measured by an IR light detector. Chemical CO₂ gas sensors with sensitive layers based on polymer- or heteropolysiloxane have the principal advantage of very low energy consumption, and can be reduced in size to fit into microelectronic-based systems. On the downside, short- and long term drift effects as well as a rather low overall lifetime are major obstacles when compared with the NDIR measurement principle. Most CO₂ sensors are fully calibrated prior to shipping from the factory. Over time, the zero point of the sensor needs to be calibrated to maintain the long term stability of the sensor.

Global advanced CO₂ sensors key players include Murata, Amphenol, Sensirion and Cubic Sensor and Instrument. Global top 4 manufacturers hold a share about 36%. The global origins are mainly located in North America, Europe, China, Japan and South Korea. In terms of product, NDIR CO₂ sensor is the largest segment, with a share about

99%. And in terms of application, the largest application is industrial, with a share about 27%.
