Abstracts

Parenteral drug delivery systems are those devices that inject the medicine doses other than oral route. Parenteral administration route is coined as the most common and efficient for drug delivery of active drug substances with poor bio-availability and drugs with a narrow therapeutic index. For parenteral drug delivery to be an efficient and effective treatment it is often appropriate to uphold systemic drug levels within the therapeutically effective concentration range in cases of long treatment. Overall, the technique seeks to optimize therapeutic index by enabling immediate drug due to the systemic pool in desired quantities.
