Abstracts

The global Aerial Survey Services market size is expected to reach \$ 17310 million by 2032, rising at a market growth of 4.0% CAGR during the forecast period (2026-2032).

Aerial survey is a method of collecting geomatics or other imagery by using airplanes, helicopters, UAVs, balloons or other aerial methods. Typical types of data collected include aerial photography, Lidar, remote sensing (using various visible and invisible bands of the electromagnetic spectrum, such as infrared, gamma, or ultraviolet) and also geophysical data (such as aeromagnetic surveys and gravity. It can also refer to the chart or map made by analysing a region from the air. Aerial survey is better resolution, quality and atmospheric conditions (which can negatively impact and obscure satellite observation). This report focuses on Aerial Survey Services market.

As the technology improves and federal regulations ease, aerial surveying is steadily moving away from manned aerial surveying teams and towards unmanned aerial vehicles (UAVs). UAV technology has advanced to the extent that it is faster, safer, easier, and more affordable than manned aerial surveying for many use cases. Unmanned aerial surveying resolves many of the traditional issues with manned operations. In particular, UAVs are now being utilized heavily in agriculture, real estate, utilities, construction, filmmaking, and even law enforcement. UAVs can fly lower than manned vehicles, thereby allowing them to take the place of both manned aerial surveys and, in some cases, ground crews as well. This reduces the necessity for consolidating information between different companies. Because UAVs can travel lower to the ground, they also complete aerial surveying with greater detail, allowing for more accurate results.

This report studies the global Aerial Survey Services demand, key companies, and key
