According to our (Global Info Research) latest study, the global Aeroderivative Gas Turbine market size was valued at USD 1341.8 million in 2023 and is forecast to a readjusted size of USD 1492.3 million by 2030 with a CAGR of 1.5% during review period.

The aeroderivative gas turbine is a lighter weight variation of a gas turbine. Despite being classified as a gas turbine, the fuel source for the aeroderivative turbine is not really gas. Actually, they are designed so that fuel and air are mixed and then ignited to achieve the desired output. The design of gas turbines is comprised of a compression device to facilitate the taking in of air and compressing it (the “gas” in this case) and then applying heat by means of a burner. The resulting flow of hot air is used as the source of powering the turbine. Today, these are typically designed to make use of a combustion process that is continuous as opposed to the intermittent nature of automotive combustion engines.

Global aeroderivative gas turbine main manufacturers include GE, Siemens, MHPS, etc. As for the types of products, it can be divided into below 30MW and more than or equal to 30MW. The most common product is more than or equal to 30MW, with a share over 75%. In terms of applications, it is widely used in mobility, power generation, oil and gas. The most common application is in power generation, with a share over 70%.
