According to our (Global Info Research) latest study, the global Aeroesol Monitoring Systems market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Radioactive aerosol monitoring system is a device and technology used to detect and monitor radioactive aerosol particles in the air. Radioactive aerosols refer to tiny particles containing radionuclides suspended in the air.

Radioactive aerosol monitoring systems usually include sampling equipment, radioactivity measuring instruments and data processing systems. Sampling equipment is used to collect radioactive aerosol samples in the air, and different sampling methods can be used, such as adsorption filtration, impact sampling, etc. Radioactive measuring instruments are used to measure and analyze radionuclides in collected samples to determine important parameters such as the concentration, composition and radioactive intensity of radioactive aerosols. The data processing system is used to process and analyze monitoring data and generate corresponding reports and charts.

Currently, the typical models of Aeroesol Monitoring Systems include Thermo Fisher Scientific's FHT 59, Mirion's iCAM, etc.
