According to our (Global Info Research) latest study, the global Aerospace Defense Ice Rain Protection Systems market size was valued at US\$ 3103 million in 2024 and is forecast to a readjusted size of USD 3597 million by 2031 with a CAGR of 2.2% during review period.

Aerospace Defense Ice Rain Protection Systems are assembled to prevent atmospheric icy rain from building up on aircraft surfaces such as wings, propellers, engine intakes, environmental control intakes, and rotor blades. If ice is allowed to assemble on the flight control surfaces and airfoil surfaces, the handling, control and performance of the aircraft will be degraded. This accumulation may enhance aerodynamic drag and reduce aerodynamic lift.

Deicing is the process of removing snow, ice and frost from a surface using specific chemicals and infrared heating. This deicing fluid consists of propylene glycol and additives used in the deicing process. During infrared heating, this heat exchange method is much faster than deicing methods commonly used in conventional heat exchange types due to the cooling effect of the air on the deicing fluid spray.
