Abstracts

African Trypanosomiasis, also known as sleeping sickness disease, is one of the rarest infectious diseases that can affect one's sleep pattern to a great extent. It is a parasitic disease caused by protozoan parasite of genus *Trypanosoma* and is carried by tsetse fly. There are two types of African Trypanosomiasis depending on the parasite: East African Trypanosomiasis caused by *Trypanosoma brucei rhodesiense* and West African Trypanosomiasis caused by *Trypanosoma brucei gambiense*.

SCOPE OF THE REPORT:

This report studies the African Trypanosomiasis market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the African Trypanosomiasis market by product type and applications/end industries. According to WHO, 25,000 new cases of both East and West African Trypanosomiasis are reported each year globally. African Trypanosomiasis is primarily found in subtropical and equatorial Africa. The major driving factors for the growth of the African Trypanosomiasis market in this region are constantly growing number of poor population in East African, prevalence of unhygienic environment, rapid pace of technological advancement in the field of African Trypanosomiasis therapeutics, increasing number of population to opt for healthy lifestyle and the overall growing diagnostic and therapeutic market. On the other hand, the huge cost of drugs involved in the treatment of African Trypanosomiasis and difficulty in availability of these medications would most likely impede the growth of this market. The symptoms associated with African Trypanosomiasis vary from one stage to another. There are two stages which are as follows. First Stage (Hemolymphatic stage): The first

stage is known as hemolympatic stage due to the blood and lymphatic systems associated with this stage. During this stage, the skin infected by the tsetse fly form a trypanosomal chancre and the lymph nodes of the immune system become infected and enlarged. The various symptoms of the hemolympatic stage are intermittent fever, headaches, skin lesions, facial edema, tachycardia and weight loss. Second stage (Neurologic or encephalitic stage): During the second stage, the brain becomes affected with few troubles in concentrating. The various symptoms of the neurologic stage are muscle weakness, behavioral changes such as irritability and mood swings, paralysis of a limb, speech disorders and sensory disorders. The global African Trypanosomiasis market is valued at xx million USD in 2017 and is expected to reach xx million USD by the end of 2023, growing at a CAGR of xx% between 2017 and 2023.
