According to our (Global Info Research) latest study, the global Agentless Discovery Tool market size was valued at US\$ 393 million in 2024 and is forecast to a readjusted size of USD 593 million by 2031 with a CAGR of 6.0% during review period.

An agentless discovery tool is a software application that can collect data and monitor IT assets on a network without the need to install any agent software on the endpoints. It utilizes protocols and APIs such as the Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI), WinRM, SSH, or the Common Information Model (CIM). It has an agent installed on each network device, and the agentless discovery tool can send requests to these agents to obtain device information, such as device status, configuration, and performance data. The tool runs on a server and uses remote access methods to collect data from target systems. It can query multiple devices and systems across the network simultaneously to obtain a comprehensive inventory of IT assets, including hardware, software, and network configurations.

With the widespread application of the Internet of Things, agentless discovery tools will be increasingly integrated with IoT devices to monitor and manage IoT - connected devices and collect data. This enables organizations to have a more comprehensive understanding of their overall IT ecosystem, including both traditional IT equipment and IoT - enabled devices. SMEs have a growing demand for IT asset management solutions. Agentless discovery tools, which are easy to deploy and cost - effective, are well - suited to meet the needs of SMEs for quickly and accurately understanding their IT assets. These tools can help SMEs better manage their limited IT resources, improve asset utilization, and reduce management costs. The increasing trend of remote work

has led to a growing demand for remote support and maintenance tools. Agentless discovery tools allow IT support teams to quickly diagnose and solve technical problems on employees' devices without the need to install agents, reducing device downtime and improving employee productivity. They are also widely used in government agencies, educational institutions, and other industries to provide efficient and secure remote assistance.
