Abstracts

According to our (Global Info Research) latest study, the global Aggregate Recycling market size was valued at US\$ 5221 million in 2025 and is forecast to a readjusted size of US\$ 9550 million by 2032 with a CAGR of 9.0% during review period.

Aggregate recycling involves the process of collecting, processing, and repurposing construction and demolition waste materials, such as concrete, asphalt, bricks, and soil. The goal is to convert these materials into reusable aggregates for new construction projects.

Several strong forces are driving market growth:

Government Regulation & Circular Economy Targets: This is the most powerful driver. Policies such as the EU's Digital Waste Shipment System, China's Beidou truck tracking, and India's construction waste management rules are cracking down on illegal dumping and mandating recycling.

Cost Advantage Against Virgin Aggregates: Rising quarry costs, driven by carbon pricing and diesel levies, are making recycled aggregates increasingly competitive. In some U.S. metro areas, recycled concrete is now being sold at a discount to virgin stone.

Advanced Processing Technology: Innovations like mobile carbon-mineralization units (which embed CO₂ into crushed concrete) and AI-optimized crushers (which can cut processing costs by over 18%) are improving the quality and economics of recycled materials, making them eligible for new, high-performance applications.

Corporate Consolidation: Major building materials companies like Heidelberg Materials and Holcim are actively acquiring recycling firms to secure material supply and meet sustainability targets, signaling a strong institutional commitment to the market.
