Abstracts

Agricultural fumigants play a significant role in agriculture, turf grass and nursery which makes soil fumigation a beneficial process for farmers as well as food consumers. Fumigation is a pest control technique in which the land is filled with gaseous fumigants to free the land from disinfectants. Soil fumigants are implemented before crop plantation to eradicate the pests present in the soil.

Soil fumigants fight against soil-borne pests, including nematodes, fungi, bacteria, weeds, and insects. Particularly used for potato, tomato, carrot, and strawberry, and among various other fruits and vegetables. When applied to the soil, it instantly gets converted into gas and forms a protection layer around the root; this in turn protects the crop from harmful pathogens present in the soil.
