## Abstracts

The global AI Decision-Making Software market size is expected to reach \$ 1257 million by 2032, rising at a market growth of 9.9% CAGR during the forecast period (2026-2032).

AI Decision-Making Software refers to software systems that utilize artificial intelligence technologies such as machine learning, deep learning, data mining, and knowledge graphs to process, analyze, and model complex data, thereby assisting or replacing humans in making logical judgments and decisions. Its core functions include data perception, pattern recognition, predictive inference, and strategy optimization. It can extract key insights from massive amounts of information and provide explainable decision-making suggestions in uncertain environments. This type of software is widely used in fields such as financial risk control, supply chain scheduling, medical diagnosis, marketing, and industrial control, aiming to improve decision-making efficiency, reduce human bias, achieve automated operations, and support enterprises in forming an intelligent decision-making closed loop in a dynamic competitive environment.

The AI ??Decision-Making Software industry generally boasts high gross margins, typically ranging from 65% to 85%. Standardized SaaS products, due to their low marginal costs and high replicability, achieve gross margins of 75% to 85%. Project-based software requiring customized development, local deployment, and long-term implementation services, however, has relatively lower gross margins, around 55% to 70%. In terms of cost structure, R&D personnel salaries and computing resource investment account for the largest share. At the market level, the global market continues to expand. North America and Europe dominate in sectors with high compliance requirements, such as finance and healthcare. The Asia-Pacific region, benefiting from the intelligent transformation of manufacturing and policy-driven growth,

has become the fastest-growing region. The upstream of the industry chain consists of chip manufacturers, cloud computing service providers, and data service providers, while the downstream covers industries such as finance, manufacturing, energy, and retail. Drivers of demand growth include the deepening of enterprise digital transformation, increased demand for data asset value mining, greater pressure to reduce costs and increase efficiency, and the intelligent upgrade in decision-making brought about by breakthroughs in generative AI technology. Future business opportunities are concentrated in deep solutions for vertical industries, the integration of generative AI with decision-making scenarios, edge intelligent decision-making, and the penetration of lightweight products for SMEs. Companies with accumulated industry knowledge, interpretable models, and the ability to deploy privately will have a core advantage in market competition.
