The global AI Drug Discovery Platform market size is expected to reach \$ 6195 million by 2032, rising at a market growth of 21.5% CAGR during the forecast period (2026-2032).

An AI Drug Discovery Platform is a technology platform that utilizes artificial intelligence, computational biology, cheminformatics, and other technologies to digitally model and optimize the entire drug development process. Its core functions include target identification, molecular design and screening, efficacy and toxicity prediction, and preclinical research optimization. By analyzing massive amounts of biological data, it enables a shift from an 'experience-driven' to a 'data-driven' R&D paradigm, significantly improving the efficiency of new drug development, reducing costs, and shortening the development cycle.

The prospects of AI Drug Discovery Platforms are widely considered one of the most disruptive directions in the pharmaceutical industry. With the continuous rise in new drug development costs and development cycles exceeding 10 years, the efficiency bottlenecks of traditional models are becoming increasingly apparent. Breakthroughs in areas such as protein structure prediction, molecular generation, and virtual screening using AI technology are significantly shortening development time and increasing success rates. Simultaneously, large pharmaceutical companies are accelerating their collaborations with AI companies, and capital continues to flow in, driving rapid industry development. In the future, this platform will further integrate with automated experiments, personalized medicine, and digital therapies, becoming one of the core infrastructures for new drug development.
