## Abstracts

According to our (Global Info Research) latest study, the global AI Image Detector market size was valued at US\$ 317 million in 2025 and is forecast to a readjusted size of US\$ 564 million by 2032 with a CAGR of 8.5% during review period.

AI Image Detector is a specialized software tool powered by computer vision, machine learning (ML), large language models (LLMs), and advanced image analysis algorithms, designed to identify images generated, synthesized, or manipulated by artificial intelligence (e.g., DALL-E, MidJourney, Stable Diffusion) or editing tools (e.g., Photoshop, deepfake software). It analyzes key visual and technical features—including pixel-level artifacts (e.g., unnatural textures, inconsistent lighting, distorted edges), embedded watermarks or metadata traces from generative models, visual coherence anomalies (e.g., illogical object proportions, mismatched backgrounds), and statistical patterns unique to AI-generated content—to distinguish AI-manipulated/generated images from authentic human-captured or created ones, typically outputting a confidence score, classification label (AI-generated, authentic, or tampered), or detailed analysis report. Widely applied in content moderation (social media, news platforms), media fact-checking (deepfake mitigation), copyright protection (AI art attribution), academic integrity (image fraud prevention), and cybersecurity (disinformation countermeasures), it serves as a critical safeguard to uphold image authenticity, mitigate risks of misinformation or fraud, and ensure transparency in digital visual ecosystems.
