Abstracts

According to our (Global Info Research) latest study, the global AI in Architecture market size was valued at US\$ 1029 million in 2025 and is forecast to a readjusted size of US\$ 9615 million by 2032 with a CAGR of 29.3% during review period.

AI in Architecture refers to the application of artificial intelligence technologies—such as machine learning, generative models, computer vision, and optimization algorithms—across the architectural lifecycle, including design, planning, construction, and facility management. By leveraging data-driven modeling of spatial requirements, structural constraints, environmental conditions, and user behavior, AI enables automated design generation, performance prediction, construction optimization, and lifecycle management of buildings, thereby improving efficiency, reducing costs, and enhancing sustainability and functionality.

AI in Architecture is currently in a rapid adoption phase, particularly in design automation and early-stage architectural planning. In design workflows, AI is increasingly used for generative design, parametric optimization, and building performance simulation, significantly improving design efficiency and expanding architectural complexity. In construction and facility management, AI combined with Building Information Modeling (BIM) is enabling predictive scheduling, construction optimization, and intelligent building operations.

From an industry perspective, AI is shifting architecture from an experience-driven discipline toward a data-driven and algorithm-assisted decision-making process. However, the sector still faces challenges such as fragmented data standards, uneven digitalization across the construction industry, and unclear accountability in AI-assisted design decisions. Overall, the long-term value of AI in architecture is expected to

concentrate on design productivity improvement, lifecycle cost optimization, and construction system coordination.
