## Abstracts

According to our (Global Info Research) latest study, the global AI In Computer Vision market size was valued at US\$ 19079 million in 2025 and is forecast to a readjusted size of US\$ 35353 million by 2032 with a CAGR of 9.2% during review period.

AI In Computer Vision is a specialized branch of artificial intelligence (AI) that empowers computer systems to interpret, analyze, and understand visual data—including images, videos, 3D point clouds, and live camera feeds—by simulating the human visual perception system's ability to recognize objects, patterns, and spatial relationships. Built on foundational technologies such as machine learning (ML), deep learning (DL), computer graphics, and signal processing, it leverages advanced models like Convolutional Neural Networks (CNNs), Vision Transformers (ViTs), and multi-modal foundation models to automatically extract meaningful features from visual inputs, classify content, detect and locate objects, segment scenes into semantic regions, and even predict actions or anomalies.

AI In Computer Vision navigates a dynamic landscape shaped by key trends, significant opportunities, and persistent challenges: core industry trends include the shift from 2D to 3D visual perception, integration of multi-modal LLMs for enhanced semantic reasoning, widespread edge computing adoption via lightweight models, and convergence with generative AI and spatial computing, alongside market tier differentiation between mature smart security segments, high-value autonomous driving, and frontier generative video markets. Opportunities stem from robust global growth driven by vertical applications in industrial inspection, medical imaging, precision agriculture, and retail analytics, alongside simplified model training lowering barriers for SMEs and policy support from China's '14th Five-Year Plan' and domestic AI chip

growth. However, challenges persist, including stringent data privacy compliance under regulations like China's Personal Information Protection Law and the EU's AI Act increasing enterprise costs by 15-20%; technical limitations such as 40% accuracy drops from adversarial attacks and poor robustness in complex environments; high data annotation costs; severe talent polarization; market homogenization in smart security eroding startup share by 20%; fragmented industry standards; and lack of model interpretability limiting adoption in high-stakes sectors like healthcare and autonomous driving.
