Abstracts

The global AI in Livestock market size is expected to reach \$ 492 million by 2032, rising at a market growth of 8.7% CAGR during the forecast period (2026-2032).

AI in Livestock refers to an intelligent technology system that deeply integrates computer vision, IoT sensors, and machine learning models, applying them to the entire livestock farming process. It collects real-time data on livestock weight, body temperature, feed intake, and movement patterns by deploying high-definition cameras, sound sensors, and wearable devices within the farm. The core algorithm can automatically identify individual livestock, detect abnormal behaviors such as lameness and respiratory diseases, and accurately predict estrus and farrowing times. Furthermore, the system can dynamically adjust feed formulations based on growth curves, achieving precise feeding. This technology aims to replace traditional manual inspections, reduce the risk of disease transmission, improve reproductive efficiency and meat yield, and drive the transformation of livestock farming from experience-based to a data-driven, refined model.
