Abstracts

The global AI Intelligent Agent market size is expected to reach \$ 17559 million by 2032, rising at a market growth of 19.5% CAGR during the forecast period (2026-2032). AI agents are software entities capable of autonomously perceiving, understanding, planning, and executing tasks under set goals. They typically consist of a large model, tool invocation capabilities, memory and retrieval functions, and environmental interfaces. They can continuously make decisions and take actions throughout multi-step processes, thereby automating and scaling the closed loop of 'understanding-planning-execution-feedback.' This solves the problems of traditional automation, such as the need for manual orchestration, high costs of cross-system collaboration, and difficulty in implementing complex tasks, significantly improving efficiency and consistency. These products transform the bottleneck of 'large models with brains but no hands' into actionable business capabilities, enabling automated delivery and observable operations across applications and data.

The value chain of the AI ??agent market exhibits a clear hierarchical structure: the upstream relies on high-density GPU/ASIC computing power and multimodal model capabilities (such as context length, inference score, and tool call coverage) to provide agents with basic computing power and cognitive capabilities; the midstream consists of agent frameworks and orchestration platforms, with core parameters including task success rate, concurrent QPS, auditing and SLA, as well as the number of enterprise system adaptations and integration time, which determine the efficiency and stability of deployment; downstream applications focus on improving KPIs in industry scenarios, such as the percentage increase in human efficiency, the decrease in error rate, SLA achievement rate, and the observability of process steps and monitoring items, directly reflecting value creation; future development trends lie in multi-agent collaboration (Agentic AI), the popularization of screen understanding and UI operation, the deployment of private and edge agents, and data governance and security native,

thereby driving a comprehensive migration from single-point automation to end-to-end closed loop.
