According to our (Global Info Research) latest study, the global AI Investment Research Analysis Software market size was valued at US\$ 352 million in 2025 and is forecast to a readjusted size of US\$ 624 million by 2032 with a CAGR of 8.4% during review period.

AI Investment Research Analysis Software is an intelligent decision support system for the financial investment and research field, based on AI technologies such as machine learning, natural language processing, and knowledge graphs. It can automatically collect and process massive amounts of structured and unstructured data (such as financial reports, announcements, research reports, news, and macroeconomic data), and perform fundamental analysis, financial forecasting, risk identification, sentiment analysis, and valuation modeling through algorithmic models. This software can quickly uncover investment logic, generate investment research reports, and alert to market anomalies, assisting analysts and fund managers in improving research efficiency and decision-making accuracy, reducing human information processing bias, and serving as a core tool of modern intelligent investment research systems.

Currently, the global AI Investment Research Analysis Software market is characterized by US technological leadership, accelerated progress in China and Europe, and partial breakthroughs in other regions. The US is the most mature in terms of underlying large-scale models, data ecosystems, and commercialization. China, relying on its vast financial market and policy support, is in a rapid iteration phase from 'functional assistance' to 'deep inference.' Europe, leveraging its advantages in strict data compliance and asset management, focuses on differentiated development in interpretability and privacy computing. Japan and other regions in the Asia-Pacific

region prioritize enterprise-level applications and quantitative strategies. Future trends are moving towards multimodal integration, end-to-end automation of investment research processes, and real-time dynamic prediction. Key obstacles include: high noise and low signal-to-noise ratio in financial data limiting model reliability; regulatory compliance and data sovereignty differences restricting cross-border model training; unclear legal liability for model 'illusions' in investment decisions; and high workflow integration costs and organizational resistance between traditional investment research institutions and AI systems. Industry dynamics show that traditional financial data giants are accelerating their self-developed AI and open-source financial models are gradually emerging.
