The global AI Patent Review Software market size is expected to reach \$ 474 million by 2032, rising at a market growth of 7.7% CAGR during the forecast period (2026-2032). AI Patent Review Software is a specialized system integrating artificial intelligence technology, designed to assist or partially automate patent examination tasks. Its core lies in utilizing AI technologies such as machine learning, natural language processing, and computer vision to intelligently understand, compare, and analyze massive amounts of patent and non-patent documents, thereby improving the efficiency and quality of examination work. Key functions include: automated classification and feature extraction of technical solutions; intelligent recommendation or screening of prior art documents; assistance in assessing novelty and inventiveness; generation of preliminary examination opinions; and detection of formal defects. This software does not replace examiners but serves as an advanced decision support tool, aiming to address the challenges posed by the explosive growth of technical documents and achieve more accurate, rapid, and consistent patent examination. It is a key infrastructure for the intelligent transformation of modern patent offices.

AI Patent Review Software is extremely expensive, primarily due to cutting-edge algorithm development, top-tier technical team salaries, acquisition and annotation of massive amounts of high-quality training data, and robust computing infrastructure. Its gross margin potential is enormous (estimated to exceed 70%), but early market expansion costs are high. Profitability depends on high-value licensing or customized projects with large patent offices; once economies of scale are achieved, marginal costs are extremely low, leading to substantial long-term profits.

The future development of AI Patent Review Software will exhibit three major trends: deep intelligence, full-process coverage, and global collaboration. Technically, it will evolve from an auxiliary tool to a 'cognitive partner,' achieving deep integration and automatic comparison of technical solutions and accompanying drawings through

multimodal large-scale models, predicting examination results and grant prospects. Applications will expand from the search stage to the entire chain, including inventiveness assessment, notification generation, and patent valuation, seamlessly integrating with enterprise IP management scenarios such as patent layout and technical intelligence analysis. Major patent offices worldwide will promote the mutual recognition and sharing of data standards and AI models, building a transnational collaborative examination network. Simultaneously, the transparency, interpretability, and ethical standards of AI decision-making will become core issues in regulation and development, ensuring fair examination and a healthy intellectual property ecosystem. This report studies the global AI Patent Review Software demand, key companies, and key regions.
