## Abstracts

The global AI Photo Maker market size is expected to reach \$ 880 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032). AI Photo Maker is an application deeply integrated with artificial intelligence technology, designed to assist or lead the creation, editing, and optimization of images. Its core capabilities surpass traditional photo editing, generating entirely new, high-quality images based on text descriptions, sketches, or reference images through deep learning models; or intelligently expanding, modifying content, transferring styles, enhancing image quality, and adding or removing elements from existing photos. It significantly lowers the technical barrier to professional-level image creation, enabling non-professional users to easily transform creative ideas into visual works, and is widely used in art creation, design, marketing, social media, and personal entertainment. AI Photo Maker has a very promising future, rapidly evolving from an 'auxiliary creative tool' into a 'core content production engine and a new paradigm for visual creation.' The core driving forces come from continuous breakthroughs in multimodal large-scale model technology, the explosive market demand for personalized and customized visual content, and the maturing ecosystem of generative AI applications. Future trends will focus on three main directions: First, a leap in the realism and controllability of technological capabilities, enabling models to generate higher resolution images that better conform to physical and logical constraints, and achieve 'what you imagine is what you get' through precise conditional control; second, a profound reshaping and professionalization of workflows, with software seamlessly integrating into the complete workflows of professional photographers and designers, providing intelligent assistance across the entire chain from inspiration to finished product, and giving rise to specialized solutions for vertical industries such as e-commerce, gaming, and film and television; and third, popularization, socialization, and copyright innovation, with lightweight creation, sharing, and collaboration based on mobile devices becoming the norm, while

copyright confirmation, trading, and management of AI-generated content will form a new ecosystem and business model, promoting the healthy development of the industry.
