Abstracts

According to our (Global Info Research) latest study, the global AI-powered Digital Pathology Systems market size was valued at US\$ 901 million in 2025 and is forecast to a readjusted size of US\$ 2722 million by 2032 with a CAGR of 17.1% during review period.

AI-powered digital pathology systems use whole-slide images together with artificial intelligence algorithms, pathology image management, case collaboration and quantitative analysis to support tumor detection, grading assistance, biomarker assessment, quality control and remote consultation. These systems are typically connected with slide scanners, LIS, hospital information systems and pharmaceutical research workflows, with core value in improving diagnostic efficiency, reducing missed findings, enhancing quantitative consistency and supporting multi-center collaboration. The average gross profit margin of this product is 38%.

The AI digital pathology market is transitioning from research and pilot use toward clinical-grade deployment. Shortages of pathologists, rising oncology diagnostic demand and increasing needs for companion diagnostics and biomarker quantification are encouraging hospitals and central laboratories to build digital pathology platforms.

Product formats are moving from standalone AI algorithms toward integrated systems covering scanning, image management, case routing, AI analysis and remote consultation. Breast, prostate, gastrointestinal and lung cancer pathology, as well as immunohistochemistry quantification, are among the highest-value applications, while pharmaceutical companies are using AI pathology to improve clinical-trial sample analysis.

Growth is still constrained by slow digitization infrastructure, regulatory approval, data interoperability and pathology department budgets. Vendors with clinical validation, cross-scanner compatibility, explainable analysis and pharmaceutical collaboration experience are better positioned to build recurring revenue.
