Abstracts

The global AI-Powered Smart Chessboards market size is expected to reach \$ 1858 million by 2032, rising at a market growth of 6.4% CAGR during the forecast period (2026-2032).

AI-powered smart chessboards are innovative products that integrate physical chessboard interaction with artificial intelligence technology. Through real-time game perception, AI decision analysis, and intelligent teaching feedback, they cover all scenarios from single-player games to professional training, fundamentally changing the way traditional chess games are learned and enjoyed.

AI-powered smart chessboards are becoming a new form of chess games, making traditional games more fun and instructive through built-in AI engines or robots. Their core value lies in providing intelligent coaching, automatic refereeing, game review, and rich teaching functions to help players improve their chess skills and thinking abilities.

The core technical architecture of AI-powered smart chessboards includes a game perception layer (Hall effect, capacitive sensing, visual recognition, pressure sensor array), an AI decision-making layer (basic algorithms, advanced algorithms, lightweight optimization, adaptive learning), and an interaction and application layer (light guidance, voice interaction, APP integration, content ecosystem).

In 2025, global sales of AI-powered smart chessboards reached 16.5 million units, with a production capacity of approximately 23.5 million units. The average selling price was \$70.5 per unit, and the average gross profit margin was 40%.
