AI-powered voice-based medical record generation systems are intelligent systems that automatically generate compliant electronic medical record documents based on artificial intelligence technologies such as speech recognition, natural language processing (NLP), and machine learning. These technologies involve converting doctor-patient conversations into text, performing semantic understanding and information extraction, and ultimately generating the correct electronic medical record document.

The core upstream technologies for AI-powered voice-based medical record generation systems include Automatic Speech Recognition (ASR), Natural Language Processing (NLP), deep learning/machine learning, and medical knowledge graphs. The core midstream technologies are system development and platform integration. Downstream applications primarily include general hospitals, specialist clinics, primary healthcare facilities, and health checkup centers.

In 2025, global sales of AI-powered voice-based medical record generation systems reached 55,000 units, with a production capacity of approximately 100,000 units. The average selling price was \$2,600 per unit, and the average gross profit margin was 55%-65%.
