The global AI Rehabilitation Software market size is expected to reach \$ 158 million by 2032, rising at a market growth of 7.7% CAGR during the forecast period (2026-2032).

AI Rehabilitation Software is a digital medical tool based on artificial intelligence technology that provides personalized and precise rehabilitation assessment, training guidance, and effect management for patients with injuries, illnesses, or post-operative conditions. It collects patients' movement, physiological, and behavioral data in real time through computer vision, sensors, or human-computer interaction devices, and analyzes this data using machine learning algorithms. Its core functions include: automated assessment of functional impairments, generation and dynamic adjustment of personalized training programs, provision of real-time movement correction and feedback, adherence and progress tracking, and prediction of rehabilitation effects and risks. This software can assist or partially replace traditional manual therapy, improving rehabilitation efficiency and standardization, and is commonly used in fields such as neurorehabilitation, musculoskeletal rehabilitation, and chronic disease management in the elderly.

The cost of AI rehabilitation software primarily consists of substantial R&D investment (algorithm development, clinical validation), data acquisition and processing, continuous software iteration, and medical device certification. Its gross profit margin is typically high, reaching 60%-80% or even higher, with its core value lying in its algorithm and data barriers. However, the upfront R&D and customer acquisition costs are enormous, and profitability heavily depends on user scale and repurchase rate.

This report studies the global AI Rehabilitation Software demand, key companies, and key regions.
