## Abstracts

According to our (Global Info Research) latest study, the global AI Token Development market size was valued at US\$ 233 million in 2025 and is forecast to a readjusted size of US\$ 613 million by 2032 with a CAGR of 15.4% during review period.

AI Token Development refers to the creation and commercialization of crypto-native tokens that power AI-focused Web3 ecosystems, including decentralized compute networks, data marketplaces, model/inference services, and agent-driven applications. Unlike meme or purely speculative assets, AI tokens are typically designed with explicit utility?such as paying for GPU inference, staking to secure network services, governance voting, or unlocking access to proprietary AI tools. The market?s value proposition is to coordinate distributed AI resources via token incentives and reduce reliance on centralized cloud platforms.

From an industry chain perspective, upstream inputs include blockchain base layers (L1/L2 infrastructure), wallets and developer tooling, smart contract security/auditing services, and AI-side supply such as GPU providers, storage networks, data contributors, and model developers. Midstream participants are token issuers and protocol teams building tokenomics, staking mechanisms, fee/burn models, and on-chain marketplaces to match AI demand with decentralized supply. Downstream users include AI developers, enterprises experimenting with decentralized inference, agentic AI builders seeking open ecosystems, and retail participants providing liquidity, governance participation, or compute/data contributions through staking.

Gross margins vary widely because many AI token projects are closer to ?protocol economics? than traditional product sales. Software-heavy platforms and marketplaces

can achieve high gross margins if they capture transaction fees with low marginal cost, especially when demand scales faster than infrastructure expenses. However, margins can be pressured by incentive emissions, liquidity mining, ongoing security costs, and real-world compute expenses when projects subsidize GPU access. The most sustainable models are those that align token utility with recurring network usage and reduce reliance on inflationary rewards over time.

Key market dynamics include volatile pricing driven by broader crypto cycles, regulatory uncertainty around token classification, and increasing buyer focus on real usage metrics (active wallets, paid inference volume, node uptime, and retention) rather than narrative alone. Competitive differentiation depends on credible token utility, robust economic design, reliable execution of decentralized infrastructure, and partnerships that onboard real AI workloads. Over the medium term, the market is likely to consolidate around projects that prove measurable cost/performance advantages and build defensible ecosystems beyond speculation.
