Abstracts

According to our (Global Info Research) latest study, the global AI Workflow Automation market size was valued at US\$ 1050 million in 2025 and is forecast to a readjusted size of US\$ 1983 million by 2032 with a CAGR of 9.6% during review period.

AI Workflow Automation refers to embedding artificial intelligence technologies (such as machine learning, natural language processing, computer vision, and large language models) into business processes to achieve intelligent and automated operation across the entire process, from task identification and decision-making to execution and exception handling. Its core characteristics include: the ability to process unstructured data, autonomous judgment and dynamic adaptation capabilities, support for human-machine collaboration, and seamless cross-system integration. Compared to traditional Robotic Process Automation (RPA), which only follows fixed rules, AI workflow automation can understand semantics, recognize intent, and make flexible decisions in complex scenarios. This technology is widely used in areas such as intelligent approval, automated customer service, document processing, supply chain collaboration, and financial reconciliation, aiming to improve efficiency, reduce human intervention, shorten business response time, and drive the evolution of enterprise operations from process-driven to intelligence-driven.

The AI Workflow Automation industry generally boasts high gross margins, typically ranging from 60% to 85%. R&D investment and computing resources account for the largest share of the cost structure. At the market level, the global market is expanding rapidly. North America and Europe dominate in sectors with high compliance requirements, such as finance and healthcare, while the Asia-Pacific region, benefiting from enterprise digital transformation and policy support, has become the fastest-

growing region. The upstream of the industry chain consists of cloud computing service providers, AI chip manufacturers, and data service providers; the downstream covers industries such as finance, manufacturing, retail, government, and healthcare. Drivers of demand growth include increased pressure on enterprises to reduce costs and increase efficiency, a surge in demand for unstructured data processing, breakthroughs in large language model technology lowering the barriers to intelligentization, and increased complexity in cross-system collaboration. Future business opportunities are concentrated in in-depth industry solutions, native workflow applications using large models, lightweight products for SMEs, and edge intelligent automation.
