Abstracts

According to our (Global Info Research) latest study, the global Air Dynamic Sieving Instrument market size was valued at US\$ 130 million in 2024 and is forecast to a readjusted size of USD 168 million by 2031 with a CAGR of 3.8% during review period.

The air dynamic sieving instrument uses negative pressure suction or positive pressure blowing to make the air flow pass through the screen and impact the powder particles. Under negative pressure, the agglomerated particles are deagglomerated and sieved through the screen. Fine particles enter the cyclone separator through the screen, while coarse particles remain on the screen, thus achieving the separation of coarse and fine particles. The air dynamic sieving instrument is mainly used for particle size detection of laboratory powder samples. It can effectively prevent the occurrence of particle agglomeration and improve the accuracy and efficiency of sieving. In addition, the equipment is also suitable for particle size analysis in scientific research, teaching, and pharmaceutical, food, chemical and other industries.
