Air floating guide rail? is a guide rail system based on the dynamic and static pressure effect of gas. It uses compressed air to float moving parts to achieve smooth movement without friction and vibration. Its core feature is the use of air static pressure to lubricate the support, and there is no direct contact between the guide rail and the support body, thereby reducing friction and wear and improving movement accuracy and guidance accuracy?. Air-bearing guide rails have the characteristics of high precision, low friction, and long life. Because of their unique working principles and various structural forms, they play an important role in the field of precision machinery.
