The global Air Flotation Lawnmower market size is expected to reach \$ 564 million by 2032, rising at a market growth of 4.0% CAGR during the forecast period (2026-2032).

An air-floating lawnmower is a lawn mower that uses high-speed rotating blades to generate a downward airflow, creating an air cushion at the bottom of the machine, allowing it to glide lightly above the ground. Unlike traditional wheeled lawnmowers, air-floating lawnmowers do not rely on wheels for movement; instead, they glide on the lawn surface using an air cushion, resulting in exceptional flexibility and the ability to operate on slopes, uneven terrain, and complex lawn areas. These devices are typically lightweight and compact, making them suitable for home gardens, steep lawns, embankments, and hard-to-reach lawn areas. The upstream of the air-floating lawnmower industry chain includes suppliers of small engines or motors, lightweight plastic or metal housings, cutting blades, and electronic control components. The midstream consists of complete machine manufacturers, primarily engaged in airflow structure design, blade system development, and complete machine assembly. Downstream users mainly include home gardeners and landscaping companies. Global production of air-floating lawnmowers is estimated at approximately 1.28 million units in 2025, with an average global market price of approximately US\$320 per unit. The gross profit margin of major companies in the industry is approximately 20%-35%. Global production capacity of air-floating lawnmowers is projected to reach approximately 1.71 million units by 2025. These products are sold to companies, golf course maintenance teams, and municipal park management departments. Sales channels primarily include garden equipment dealers, hardware retailers, and e-commerce platforms.
