An air and vapor barrier system is a building material designed to control the movement of air and moisture through walls, roofs, and other structural components, enhancing energy efficiency and durability. Typically made from sheets or membranes of materials like polyethylene, asphalt, or rubberized asphalt, these barriers are installed to prevent air leaks and reduce moisture infiltration, which can lead to mold growth, structural damage, and decreased insulation effectiveness. Air and vapor barriers are essential in both residential and commercial construction, as they help maintain a stable indoor environment by reducing heating and cooling costs and protecting building materials from moisture-related deterioration. Their application is especially important in climates with extreme temperatures or high humidity, where controlling air and vapor movement is critical for building performance and occupant comfort.
