The gross profit margin of major companies in the industry is between 25%-40%.

In 2025, the global production capacity of Air Pollution Monitoring Station was approximately 64,000 units.

Air Pollution Monitoring Station is an environmental monitoring system designed to continuously measure and analyze atmospheric pollutants and air quality parameters. The system integrates gas sensors, particulate matter detectors, sampling modules, communication units, data processing equipment, and monitoring platforms to provide real-time information on pollutants such as PM2.5, PM10, NOx, SO2, CO, and ozone. It is widely used in urban environmental monitoring, industrial emission management, smart city systems, and public health applications. The product boundary includes fixed and integrated air quality monitoring stations, excluding individual sensors and software-only monitoring platforms.

The air pollution monitoring station industry chain includes upstream suppliers of sensors, optical components, electronic modules, communication devices, power systems, and structural materials; the midstream sector covers station design,

equipment integration, calibration, installation, and maintenance; the downstream sector includes government environmental agencies, industrial enterprises, urban management systems, research institutions, and public monitoring networks. Market growth is driven by stricter environmental regulations, smart city development, and increasing demand for real-time air quality data.
