According to our (Global Info Research) latest study, the global Air Sensor market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

An air sensor is a device designed to detect and measure the concentration of various gaseous pollutants, such as carbon monoxide, nitrogen oxide, sulfur dioxide, ozone, and fine particulate matter (PM2.5) in the air. Air sensors can be used for a wide range of applications, including environmental monitoring, air quality management, industrial processes, transportation, and health and safety.

Air sensors typically work by detecting changes in the property of substances that are present in the air, such as changes in the levels of pollutants or in temperature or pressure. They convert these signals into measurable electrical or optical signals that can be analyzed and interpreted using specialized software or equipment. Air sensors come in different types, including electrochemical, photoionization, semiconductor, and optical sensors.
