In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The air source heat pump water heater is an energy-efficient hot water supply system that uses low-grade heat energy in the air and converts it into high-grade heat energy through a compressor and refrigerant circulation system to heat water. This technology not only reduces dependence on traditional fossil fuels, but also significantly reduces greenhouse gas emissions. The working principle of the air source heat pump water heater is based on the reverse Carnot cycle: the low-temperature and low-pressure refrigerant that absorbs heat from the environment is compressed into a high-temperature and high-pressure state by the compressor, and then releases heat in the condenser to supply water, and finally returns to the evaporator through the expansion valve to reduce temperature and pressure and reabsorb heat.
