## Abstracts

The global Aircraft Bias Tires market size is expected to reach \$ 238 million by 2032, rising at a market growth of -2.1% CAGR during the forecast period (2026-2032).

Aircraft bias tires employ a multi-layered ply structure laid at a cross angle, with the carcass plies overlapping each other to create a robust and impact-resistant structure. These tires are characterized by high rigidity, impact resistance, and strong sidewalls, enabling them to withstand the instantaneous heavy loads during takeoff and landing and the impacts of uneven runways. Therefore, they remain widely used in military aircraft, general aviation, and some special operating conditions. However, compared to radial tires, they are heavier, generate more heat, have higher rolling resistance, and have slightly lower lifespan and fuel economy, but they still maintain a reliability advantage in high-impact and complex environments. In 2025, the global demand for radial aircraft tires is estimated at approximately 388,565 units, with an average unit price of approximately US\$660 per tire.

This report studies the global Aircraft Bias Tires production, demand, key manufacturers, and key regions.
