The aircraft horizontal position indicator is a key instrument in the avionics system, used to display the pitch and roll attitude of the aircraft relative to the horizon in real time to ensure flight safety. It is usually driven by a gyroscope or MEMS (micro-electromechanical system) sensor, combined with a digital/analog display, to provide intuitive attitude information and integrate warning functions (such as stall warning). It is widely used in commercial airliners, military aircraft and general aviation, and must meet aviation safety standards such as DO-178C.
