According to our (Global Info Research) latest study, the global Aircraft Radar Radome market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The aircraft radar radome is a shell used to protect aircraft radar antennas. It is usually made of composite materials and has the characteristics of light weight, high strength and electromagnetic wave transparency. The primary function of a radome is to protect the antenna from the environment while keeping radar performance unaffected. Aircraft radar radomes generally consist of a front cover and a rear cover. During the design and manufacturing process, multiple factors such as material selection, durability, oxidation resistance, radiation resistance, temperature changes, and humidity changes need to be considered. To ensure the quality of the cover, strict quality control and testing are required. These tests include full electromagnetic testing, pneumatic testing and anti-icing testing.

The aircraft radome is a necessary component of the aircraft radar system and plays important roles in protecting the antenna, ensuring radar data, and improving flight safety. With the development of technology, future radomes may use new materials and new processes to improve their performance and reliability and provide better support for the development of aircraft radar systems.
