Abstracts

The global Aircraft Radial Tires market size is expected to reach \$ 882 million by 2032, rising at a market growth of 1.4% CAGR during the forecast period (2026-2032).

Aircraft radial tires are high-performance aviation tires used in aircraft landing gear systems. They feature a radial structure design, with the ply material arranged radially and reinforced with steel wire or high-strength material belts, providing better load-bearing capacity, wear resistance, and heat dissipation under high-speed takeoff and landing conditions. These tires need to withstand extremely high air pressure, instantaneous impact loads, and high-speed friction, and are widely used in civil passenger aircraft, cargo aircraft, and some military aircraft. Compared to traditional bias-ply tires, they offer advantages such as lighter weight, longer lifespan, and lower maintenance costs, making them one of the key safety and consumable components in modern aviation. In 2025, the global demand for radial aircraft tires is estimated at approximately 850,119 units, with an average unit price of approximately US\$880 per tire.

This report studies the global Aircraft Radial Tires production, demand, key manufacturers, and key regions.
