Abstracts

According to our latest research, the global Airframe Anti-icing System market size will reach USD 6014 million in 2031, growing at a CAGR of 6.8% over the analysis period.

Aircraft anti-icing devices refer to equipment that prevents certain protruding parts of the aircraft from icing or can effectively remove ice when ice forms. Ice on the leading edge of the wing and tail, or on the leading edge of the propeller, the leading edge of the air inlet, and the cockpit windshield can make flight dangerous in serious cases. For example, ice on the leading edge of the wing and tail may change the shape of the wing section, reduce lift, increase drag, and even make flight control difficult and unstable. Ice on other parts will also bring various difficulties. For this reason, anti-icing equipment should be installed in parts that are prone to icing.
