## Abstracts

Airport deicer is a chemical substance or mixture used to remove ice, snow, and frost from aircraft surfaces, runways, taxiways, and other airport infrastructure. Deicers are crucial for ensuring safe takeoffs and landings during winter weather conditions. These deicing agents typically consist of various compounds such as glycols (e.g., ethylene glycol or propylene glycol), salts (e.g., potassium acetate or sodium chloride), and sometimes alcohol-based solutions. They work by lowering the freezing point of water and melting existing ice or preventing the formation of new ice on surfaces. Airport deicers are applied using specialized equipment such as deicing trucks equipped with spray booms or nozzles. The deicing process involves spraying the solution onto the affected surfaces, allowing it to break down and remove ice and snow effectively.

According to our (Global Info Research) latest study, the global Airport Deicer market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
