Abstracts

Anesthesia equipment is often used by medical professionals during surgical procedures to help prevent a patient from feeling pain and relax surrounding muscles. Oftentimes, anesthesia can make a patient drowsy or even unconscious, both of which are completely normal reactions to the medicine. During the procedure, an anesthesiologist will monitor the patient's vitals to ensure their well-being, and also regulate the amount of anesthesia being administered. However, doing both simultaneously can be difficult if a facility's monitoring equipment is outdated or not user-friendly.
