Abstracts

According to our (Global Info Research) latest study, the global AI-based Plagiarism Reduction Service market size was valued at US\$ 134 million in 2025 and is forecast to a readjusted size of US\$ 555 million by 2032 with a CAGR of 19.5% during review period.

AI-based Plagiarism Reduction Service uses large language models to semantically rewrite academic text, preserving original meaning, logic, data & terminology, while reducing the similarity ratio (plagiarism rate) to pass detection systems such as CNKI, Weipu, Wanfang & Turnitin. It is widely used in undergraduate & graduate thesis writing, journal submission, and project reporting. Against the backdrop of evolving academic misconduct detection systems, traditional manual rewriting and simple synonym replacement tools are no longer sufficient; AI-driven plagiarism reduction is becoming mainstream due to its semantic understanding and high-quality paraphrasing. AI-based plagiarism reduction directly affects graduation costs for millions of students, peer-review efficiency for journals, and the integrity of research integrity systems, while its market and technological shifts serve as key indicators for the ed-tech industry.

AI plagiarism reduction service rewrites academic papers semantically via large language models to lower the text similarity ratio (plagiarism rate), helping students and researchers pass detection systems such as CNKI, Weipu, and Turnitin while preserving original meaning, data, and logic. Pricing: Chinese web self-service costs about RMB 1–3 per thousand words (USD 0.15–0.45); English tools like QuillBot premium are USD 8–15/month; Turnitin institutional licenses cost tens of thousands USD annually. Margins are extremely high: marginal cost per inference is USD 0.001–0.005, while pricing to students can be tens of times higher, yielding gross

margins above 80%. Downstream primary applications: undergraduate theses account for 60–70% of usage, graduate theses and journal submissions each 10–15%, institutional batch processing and others 5–10%. Incremental demand is driven by: (i) universal adoption of plagiarism detection (e.g., Turnitin) by universities worldwide, (ii) the growing student population in China (over 50 million), and (iii) the fact that more AI-assisted writing forces detection systems to upgrade, sustaining demand for reduction tools. Landscape: China's market is highly fragmented – dozens of local tools (Zaobiao, PaperPass, SpeedAI) compete on price with web self-service; globally, rewriting tools Grammarly and QuillBot dominate traffic, while Turnitin sets the detection standard without offering reduction directly; Russia, France, Korea have their own detection systems (Antiplagiat, Compilatio, Copy Killer), with reduction services relying on local or general-purpose tools. Uncertainties include: detection algorithm updates may render existing reduction strategies ineffective; universities may shift from banning AI assistance to regulating its use (e.g., mandatory disclosure), redefining the legal boundary of reduction; and falling LLM costs could popularize free reduction tools, squeezing paid services. Conclusion: AI plagiarism reduction is a rigid-demand market created by academic misconduct detection systems. It is characterized by huge user volume, ultra-low unit price, and intense competition. Growth is driven not by technological breakthroughs but by universities' persistent reliance on detection systems and students' graduation necessity. Over the next three years, pure reduction tools will face price wars and free substitutes; comprehensive academic assistants that combine rewriting, writing coaching, and formatting will be more competitive.
