Abstracts

The global Albumin (as Excipient) market size is expected to reach \$ 2650 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

Albumin excipients refer to human serum albumin (HSA) or recombinant human serum albumin (rHSA) used as excipients in biopharmaceuticals. Their primary functions include stabilizing the structure and activity of protein drugs, enhancing drug solubility and bioavailability as carriers, and serving as nutritional components in vaccines and cell culture media. With the advancement of biologics and vaccine development, the application of albumin excipients in drug formulations is becoming increasingly widespread. In 2025, global Albumin (as Excipient) production reached approximately 440 mt, with an average global market price of around US\$ 3822 per kg.

The albumin excipient market is experiencing unprecedented growth opportunities due to the global rise in chronic diseases, rapid expansion of the biopharmaceutical industry, and increasing demand for efficient drug delivery systems. Particularly in vaccine development and gene therapy, albumin excipients have become indispensable components due to their excellent biocompatibility and stability. Furthermore, advancements in recombinant albumin technologies have made the production process safer and more controllable, further driving market growth.

Despite the promising prospects, the albumin excipient market faces several challenges. Firstly, the source and quality control of raw materials are critical, especially the supply of human-derived albumin, which may affect production stability. Secondly, stringent regulatory requirements and quality standards make the research and development process complex and time-consuming. Additionally, increasing market competition from emerging enterprises and technologies may threaten the market share

of existing companies.

Downstream demand is primarily concentrated in areas such as vaccines, cell culture media, protein drugs, and gene therapies. With the rise of personalized medicine and precision therapy, the demand for high-quality excipients continues to increase. Moreover, the growing aging population globally is driving the demand for chronic disease treatment drugs, thereby boosting the need for albumin excipients.

The main raw materials for albumin excipients include human serum albumin and recombinant bovine serum albumin. Human serum albumin is primarily sourced from plasma collection; however, its supply is limited by the number of blood donors and ethical issues related to plasma collection. On the other hand, recombinant bovine serum albumin production relies on bioreactor technology, which has higher production costs and technical requirements. Therefore, the stable supply and cost control of raw materials are key factors influencing the development of the albumin excipient market.
