## Abstracts

The global Alcohol Ethoxylates market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Ethoxylation Alcohol is a chemical reaction that replaces the hydrogen atoms in alcohol molecules with ethoxyl (C<sub>2</sub>H<sub>5</sub>O-) groups. This reaction is usually carried out at high temperature, high pressure and in the presence of an organic catalyst.

Ethoxylated alcohol can be used in the production of surfactants, softeners, lubricants, emulsifiers, antifreeze and other chemicals. By changing the number of ethoxy groups in ethoxylated alcohols, the surface tension, solubility, viscosity and other properties of these chemicals can be adjusted, so that they have better performance in different application fields.

Ethoxylated alcohols are also used in the production of personal care products such as shampoos, body washes, hand creams, etc. In these products, ethoxylated alcohol can be used as an emulsifier, thickener, emollient and softener to bring a better texture and user experience to the product.
