According to our (Global Info Research) latest study, the global Alginate Impression Materials market size was valued at USD 353.7 million in 2023 and is forecast to a readjusted size of USD 566.7 million by 2030 with a CAGR of 7.0% during review period.

Alginate is one of the commonly used dental material. Alginate impression materials are used to capture a range of dental impressions because when properly used they provide highly detailed impressions. However, because the material does not often provide lasting dimensional stability, alginate impressions must be used to create a model or temporary restoration quickly after the impression is captured. Alginates are packaged in a powdered form and must be mixed before an impression is captured. This makes the product economical and easy to store in a practice. Different alginates offering different working times and other physical properties, so it is important to find a material that is both comfortable to work with and capable of capturing the details required for high-quality dental work.
