Abstracts

The principle of the alkali spray tower is that when the exhaust gas enters from the bottom of the tower body, it contacts with the spray medium sprayed from the spray tower. After the contact, the exhaust gas or oil pollution is wrapped by water droplets, and the water droplets wrapping the pollutants collide again. The surface area increases and the gravity increase. When the gravity increases, the water droplets that wrap the pollutants will fall to the bottom of the spray tower under the influence of gravity, the heavier pollutants will sink to the bottom of the tower body, and the lighter pollutants will float on the surface of the circulating water body.
