Abstracts

The global Alkaline Refractories market size is expected to reach \$ 16400 million by 2029, rising at a market growth of 3.3% CAGR during the forecast period (2023-2029).

Alumina in basic refractories also helps to enhance the slag corrosion resistance of refractories, improve high-temperature thermoplasticity, and reduce the penetration of the slag-brick reaction interface.

With the rapid development of global special steel production, the low-carbon process of basic refractory bricks for refining outside the furnace is becoming more and more mature, and is widely used in special steel refining equipment outside the furnace, which greatly increases the life of the refining furnace. Globally, China is the largest consumer of refractory materials, accounting for more than 45% of the total consumption. Followed by Europe, the consumption share accounted for more than 13%.

Refractory alkaline materials are mainly composed of MgO and CaO, and their refractoriness is relatively high. Common types include: magnesia bricks, chrome-magnesia bricks, magnesia-alumina bricks, etc. They are mainly used in high-temperature industrial equipment to achieve energy saving, environmental protection and longevity.

This report studies the global Alkaline Refractories production, demand, key manufacturers, and key regions.
