## Abstracts

According to our (Global Info Research) latest study, the global Alkyl Halide market size was valued at US\$ 31171 million in 2025 and is forecast to a readjusted size of US\$ 43283 million by 2032 with a CAGR of 4.8% during review period.

Alkyl halides are a class of organic compounds in which one or more hydrogen atoms in an alkane are replaced by halogen atoms (fluorine, chlorine, bromine, or iodine), forming molecules with the general formula  $R^?X$  (where R is an alkyl group and X is a halogen). Industrially, their supply chain begins with upstream feedstocks such as hydrocarbons derived from crude oil or natural gas (e.g., methane, ethane, propylene) and halogen sources obtained from processes like chlor-alkali electrolysis (for chlorine) or fluorite processing (for fluorine). In the midstream, alkyl halides are produced via halogenation reactions (free radical substitution, addition reactions, or alcohol halogenation using reagents like HCl,  $SOCl_2$ , or  $PBr_3$ ), often in large-scale continuous chemical plants with strict control over reaction selectivity and safety. Downstream, these intermediates serve as key building blocks for pharmaceuticals, agrochemicals, refrigerants, solvents, polymers (e.g., PVC via vinyl chloride), and specialty chemicals, with distribution handled by chemical manufacturers and distributors supplying bulk industrial users as well as fine chemical and laboratory markets. In 2025, global Alkyl Halide output was about 31 million tons with 48 million tons of capacity, average prices of USD 900-1,500 per ton, and gross margins around 19%.
